What do computer drivers do?

Drivers allow your computer's operating system to connect with hardware and software on your computer. Every single application and piece of hardware requires a driver to properly work. The problem is that drivers are updated frequently, but not updated to your individual computer … unless you enable them to be updated.

How do old drivers cause problems?

When drivers are updated, guess what happens to those old drivers? If you just answered, *they stop working and cause problems*, you are correct. However, there's more to it than that. Computer viruses, which are so common today, can cause your computer's drivers to become corrupted or disappear entirely. When this happens, you'll need to figure which drivers are causing the problems and reinstall them.

What can you do to avoid driver headaches from occurring?

If you've used a free version of one of our driver updater programs in the past, you know how easy and valuable it is. But with the paid version of Simple Driver Updater, you also have the ability to:

- Update all your drivers with just 1 click
- Get the newest drivers as soon as they become available
- Auto schedule scans – find problems before they *become* problems

Let's face it, computer problems are annoying and time consuming. Simple Driver Updater can eliminate these issues by identifying out of date drivers then quickly and easily updating them, which will restore optimum performance to your PC and keep it running like new.

To unlock all the benefits above and keep your computer's drivers from becoming **your** problem, purchase Simple Driver Updater today, and say goodbye to driver-related headaches once and for all.
